Language: English.

AB **Bifunctional molecules** and methods for their use in the production of binary complexes in a host are provided. The **bifunctional molecule** is a conjugate of a drug moiety and a presenter protein ligand. The molecular weight of the

**bifunctional molecule** is preferably less than about **5000 daltons**, and the drug moiety may have a molecular weight of from about 50 to 2000 daltons. The drug moiety and presenter protein ligand may be covalently linked directly or through a linking group. The drug moiety binds to a drug target such as a protein and the presenter protein ligand binds to a presenter protein that is not the drug target such as extracellular or intracellular protein. Presenter proteins include peptidyl prolyl isomerase (FKBP), Heat Shock Protein 90 (Hsp90), steroid hormone receptors, cytoskeletal proteins, albumin and vitamin receptors. When the presenter protein is FKBP, ligands include FK506, rapamycin and cyclosporin A which may have an introduced functional group such as hydroxyl, amino, carboxyl, aldehyde, carbonate, carbamate, azide, thiol or ester for attaching the drug moiety. In the methods of use, an effective amount of the **bifunctional molecule** is administered to the host. The **bifunctional molecule** binds to the presenter protein to produce a binary complex such that the drug exhibits at least one of improved affinity, specificity or selectivity as compared to the corresponding free drug. The methods and **bifunctional molecules** find use in a variety of therapeutic applications.

2000:332410 Improving protein-ligand interactions.. Wandless, Thomas J. (Department of Chemistry, Stanford University, Stanford, CA, 94305-5080, USA). Book of Abstracts, 219th ACS National Meeting, San Francisco, CA, March 26-30, 2000, ORGN-283. American Chemical Society: Washington, D. C. (English) 2000. CODEN: 69CLAC.

AB One strategy to improve the binding between a small mol. ligand and its protein receptor is to increase the surface area at the binding interface. Addnl. interactions may contribute, either pos. or neg., to the overall free energy of binding. We have developed a potentially general method to improve or diminish the binding affinity between a ligand and its **protein target**. The X-ray structures of two different small mols. bound to two different **protein targets** were analyzed. Synthetic chem. was used to link the two compds., thus creating a bifunctional ligand for both proteins. When tethered with the proper geometry, the **bifunctional mol.** allows both protein receptors to bind simultaneously, and addnl. protein-protein interactions are created that contribute pos. or neg. to the overall stability of the trimeric complex.

1999162539 Document Number: 99162539. PubMed ID: 10051576. Affinity modulation of small-molecule ligands by borrowing endogenous protein surfaces. Briesewitz R; Ray G T; Wandless T J; Crabtree G R. (Howard Hughes Medical Institute, Stanford University, Stanford, CA 94305, USA.) PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES OF THE UNITED STATES OF AMERICA, (1999 Mar 2) 96 (5) 1953-8. Journal code: 7505876. ISSN: 0027-8424. Pub. country: United States. Language: English.

AB A general strategy is described for improving the binding properties of small-molecule ligands to **protein targets**. A **bifunctional molecule** is created by chemically linking a ligand of interest to another small molecule that binds tightly to a second protein. When the ligand of interest is presented to the target

protein by the second protein, additional protein-protein interactions outside of the ligand-binding sites serve either to increase or decrease the affinity of the binding event. We have applied this approach to an intractable target, the SH2 domain, and demonstrate a 3-fold enhancement over the natural peptide. This approach provides a way to modulate the potency and specificity of biologically active compounds.

WO 2001035978 A1 20010525, 31 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CR, CU, CZ, DE, DK, DM, DZ, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, TZ, UA, UG, US, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (English). CODEN: PIXXD2. APPLICATION: WO 2000-US31702 20001117. PRIORITY: US 1999-PV166580 19991119.

AB Targeted **bifunctional mols.** and methods for their use are provided. The subject targeted **bifunctional mols.** are conjugates of a drug moiety and a targeting moiety, where these two moieties are optionally joined by a linking group. The **bifunctional mols.** are further characterized in that they exhibit a modulated biodistribution upon administration to a host as compared to a free drug control. The subject targeted **bifunctional mols.** find use in a variety of therapeutic applications. For example, a **bifunctional mol.** consisting of a drug moiety covalently joined to sulfoxazole which is extensively bound by albumin, via an inert linking group is formed. When this **bifunctional mol.** enters the human circulation, it is bound by albumin which keeps the drug of interest in the extracellular environment.

2001:203206 Cell-selective detoxification by borrowing endogenous proteins. Lin, Yun-Ming; Braun, Patrick D.; Ray, Gregory T.; Wandless, Thomas J. (Department of Chemistry, Stanford University, Stanford, CA, 94305, USA). Abstracts of Papers - American Chemical Society, 221st, ORGN-698 (English) 2001. CODEN: ACSRAL. ISSN: 0065-7727. Publisher: American Chemical Society.

AB Undesired side effects to mammalian cells are often encountered in enzyme inhibitor-based chemotherapy. Potential cell-selective detoxification could be achieved by converting therapeutic agents into **bifunctional mols.** capable of recruiting endogenous proteins unique to mammalian cells as their protecting groups. Covalent attachment of a dihydrofolate reductase (DHFR) inhibitor to a synthetic ligand (SLF) for **FK506** binding proteins (FKBP) affords a **bifunctional mol.** which retains efficacy against DHFR. However, this efficacy is diminished or lost in the presence of FKBP, presumably due to unfavorable protein-protein interactions in the trimeric complex. Borrowing endogenous proteins by **bifunctional mols.** to achieve cell-selective detoxification could provide a novel strategy for drug development. The synthesis and biochem. assay of a **bifunctional mol.** for DHFR and FKBP will be presented.

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\*

AB A synthetic ligand for the protein FKBP12 was covalently linked to a peptide ligand (pYEEI) for the Fyn SH2 protein to create a **bifunctional molecule** called SLFpYEEI. This **bifunctional molecule** can simultaneously bind both proteins to form a trimeric complex. When SLFpYEEI is precomplexed with FKBP12, the peptide ligand binds 6-fold more weakly to the Fyn SH2 domain than SLFpYEEI alone. Isotope-edited NMR spectroscopy was used to investigate the molecular basis for the observed reduction in affinity. The results suggest that interactions between the pYEEI peptide and FKBP12 may play a significant role in diminishing the affinity of SLFpYEEI for the Fyn SH2 domain.

WO 9961055 A1 19991202, 67 pp. DESIGNATED STATES: W: AE, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, CA, CH, CN, CU, CZ, DE, DK, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MD, MG, MK, MN, MW, MX, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, UA, UG, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG. (English). CODEN: PIXXD2. APPLICATION: WO 1999-US11296 19990521. PRIORITY: US 1998-86451 19980522.

AB Non-naturally occurring bifunctional conjugates Z-L-X (Z = ligand that binds to a specific presenter protein; X = drug moiety; L = optional linker) are provided such that upon entering a cell, Z can bind to its receptor protein (if present) and the effectiveness of X is thereby enhanced or inhibited, depending on the nature of the receptor for Z. Thus, a bifunctional peptide (I) was prep'd. which contained **FK506** coupled to phosphotyrosyl-glutamyl-glutamyl-isoleucine (pYEEI), which binds to the SH2 domains of tyrosine kinases Fyn and Lck and to the N-terminal SH2 domain of phospholipase C.gamma. (PLC.gamma.). In the presence of **FK506**-binding protein 52 (FKBP52), I bound the Fyn SH2 domain with 3-fold increased affinity. This effect was reversed by **FK506**, and was not mimicked by FKBP12 despite the similar structure of its binding domain to that of FKBP52; the increase in affinity with FKBP52 was presumably based on favorable protein-protein interactions between the Fyn SH2 domain and FKBP52. On the other hand, formation of a FKBP12-I complex reduced the affinity of I for the PLC.gamma. SH2 domain but not for the Fyn or Lek SH2 domains, suggesting that formation of a binary complex may lead to unfavorable protein-protein interactions between the presenter protein and some targets but not other targets of the drug; therefore, formation of a complex between a **bifunctional mol.** and a presenter protein can be used to create specificity. The cell selectivity of a bifunctional conjugate may be enhanced if the formation of a binary complex reduces binding of the drug to all of its targets in a cell that contains the presenter mol.; if an organism has cells that contain the presenter protein and other cells that do not, the cells lacking the presenter protein will be more affected by the bifunctional conjugate than cells expressing the presenter. Similarly, conjugation of penicillamine (an alk. phosphatase inhibitor) to p-aminosalicylic acid (a ligand for albumin) via glycine modulated the inhibitory activity of penicillamine toward 4 isoforms of alk. phosphatase in the presence of 100 .mu.M serum albumin, but not toward 8 other isoforms.

2002:165031 Document No. 136:195367 NF-AT (nuclear factor, activated T-cell)  
cytosolic and nuclear polypeptides and their use in screening for  
immunosuppressive agents. **Crabtree, Gerald R.**; Northrop,  
Jeffrey P.; Ho, Steffan N.; Flanagan, William M. (The Board of Trustees of  
the Leland Stanford Junior University, USA). U.S. US 6352830 B1 20020305,  
83 pp., Cont.-in-part of U. S. 5,989,810. (English). CODEN: USXXAM.  
APPLICATION: US 1999-232346 19990115. PRIORITY: US 1991-749385 19910822;  
US 1993-124981 19930920; US 1994-228944 19940418; US 1994-260174 19940613;  
US 1995-507032 19950731.

AB The invention provides novel polypeptides which are assocd. with the  
transcription complex NF-AT, and polynucleotides encoding such  
polypeptides. Specifically, NF-ATc (cytoplasmic) and NF-ATn (nuclear)  
proteins assoc. in a complex that interacts with an NF-AT DNA binding  
sequence which may be studied using gel mobility shift assays. The NF-ATc  
is translocated to the nucleus by an immunosuppressive agent.  
Immunosuppressive agents may be identified by contacting a NF-ATc protein  
with a test agent and detg. the level of said complex formation.  
Furthermore, the NF-ATc or NF-ATn proteins may be immobilized. An NF-AT  
regulated enhancer region may be linked to a nucleic acid that encodes a  
protein essential for cell proliferation of viability to assay for nuclear  
translocation of NF-ATc. Also provided are antibodies to NF-AT  
polypeptides, polynucleotide hybridization probes and PCR amplification  
probes for detecting polynucleotides which encode such polypeptides.  
Transgenes which encode such polypeptides, homologous **targeting**  
constructs that encode such polypeptides and/or homologously integrate in  
or near endogenous genes encoding such polypeptides are provided.  
Non-human transgenic animals which comprise functionally disrupted  
endogenous genes that normally encode such polypeptides, and transgenic  
nonhuman animals which comprise transgenes encoding such polypeptides are  
also provided. Methods for detecting T cells (including activated T  
cells) in a cellular sample and methods for treating hyperactive or  
hypoactive T cell conditions are also provided. Methods for screening for  
immunomodulatory agents, methods for diagnostic staging of lymphocyte  
differentiation, methods for producing NF-AT proteins for use as research  
or diagnostic reagents, methods for producing antibodies reactive with the  
novel polypeptides, and methods for producing transgenic nonhuman animals

are other embodiments of the invention. Methods and agents for activation of NF-AT dependent transcription, including agents which interfere with the prodn., modification of nuclear or cytoplasmic subunits, or the nuclear import of the cytoplasmic subunits are provided. In particular, screening tests for novel immunosuppressants are provided based upon the ability of NF-AT to activate transcription.

L15 ANSWER 2 OF 11 CAPLUS COPYRIGHT 2003 ACS

2001:27418 Document No. 134:96299 NF-AT polypeptides and polynucleotides and method for detection of T cells. **Crabtree, Gerald R.**; Northrop, Jeffrey P.; Ho, Steffan N. (The Board of Trustees of the Leland Stanford Junior University, USA). U.S. US 6171781 B1 20010109, 99 pp., Cont.-in-part of U.S. Ser. No. 260,174. (English). CODEN: USXXAM. APPLICATION: US 1998-49691 19980327. PRIORITY: US 1993-124981 19930920; US 1994-260174 19940613.

AB The invention provides novel polypeptides which are assocd. with the transcription complex NF-AT, polynucleotides encoding such polypeptides, antibodies which are reactive with such polypeptides, polynucleotide hybridization probes and PCR amplification probes for detecting polynucleotides which encode such polypeptides, transgenes which encode such polypeptides, homologous **targeting** constructs that encode such polypeptides and/or homologously integrate in or near endogenous genes encoding such polypeptides, nonhuman transgenic animals which comprise functionally disrupted endogenous genes that normally encode such polypeptides, and transgenic nonhuman animals which comprise transgenes encoding such polypeptides. The invention also provides methods for detecting T cells (including activated T cells) in a cellular sample, methods for treating hyperactive or hypoactive T cell conditions, methods for screening for immunomodulatory agents, methods for diagnostic staging of lymphocyte differentiation, methods for producing NF-AT proteins for use as research or diagnostic reagents, methods for producing antibodies reactive with the novel polypeptides, and methods for producing transgenic nonhuman animals. The proteins and polynucleotides encoding NF-AT and a dominant neg. mutant of NF-AT provide reagents for screening compds. which modulate NF-AT translocation across nuclear membranes, compds. which bind to the NLS (nuclear localization sequences) of NF-AT, and compds. which promote or inhibit phosphorylation of NF-AT.

L15 ANSWER 3 OF 11 MEDLINE

2001385235 Document Number: 21332584. PubMed ID: 11439183. Signals transduced by Ca(2+)/calcineurin and NFATc3/c4 pattern the developing vasculature. Graef I A; Chen F; Chen L; Kuo A; **Crabtree G R.** (Department of Developmental Biology, Howard Hughes Medical Institute, Stanford University, Stanford, CA 94305, USA. ) CELL, (2001 Jun 29) 105 (7) 863-75. Journal code: 0413066. ISSN: 0092-8674. Pub. country: United States. Language: English.

AB Vascular development requires an orderly exchange of signals between growing vessels and their supporting tissues, but little is known of the **intracellular** signaling pathways underlying this communication. We find that mice with disruptions of both NFATc4 and the related NFATc3 genes die around E11 with generalized defects in vessel assembly as well as excessive and disorganized growth of vessels into the neural tube and somites. Since calcineurin is thought to control nuclear localization of NFATc proteins, we introduced a mutation into the calcineurin B gene that prevents phosphatase activation by Ca(2+) signals. These CnB mutant mice exhibit vascular developmental abnormalities similar to the NFATc3/c4 null mice. We show that calcineurin function is transiently required between E7.5 and E8.5. Hence, early calcineurin/NFAT signaling initiates the later cross-talk between vessels and surrounding tissues that pattern the vasculature.

AB Dimerization and oligomerization of proteins are general biological control mechanisms that contribute to the activation of cell membrane receptors, transcription factors, vesicle fusion proteins, and other classes of intra- and extracellular proteins. We have developed a general procedure for the regulated (inducible) dimerization or oligomerization of **intracellular** proteins. In principle, any two target proteins can be induced to associate by treating the cells or organisms that harbor them with cell permeable, synthetic ligands. To illustrate the practice of this invention, we have induced: (1) the **intracellular** aggregation of the cytoplasmic tail of the zeta chain of the T cell receptor (TCR)-CD3 complex thereby leading to signaling and transcription of a reporter gene, (2) the homodimerization of the cytoplasmic tail of the Fas receptor thereby leading to cell-specific apoptosis (programmed cell death) and (3) the heterodimerization of a DNA-binding domain (Gal4) and a transcription-activation domain (VP16) thereby leading to direct transcription of a reporter gene. Regulated **intracellular** protein association with our cell permeable, synthetic ligands offers new capabilities in biological research and medicine, in particular, in gene therapy. Using gene transfer techniques to introduce our artificial receptors, one can turn on or off the signaling pathways that lead to the overexpression of therapeutic proteins by administering orally active "dimerizers" or "de-dimerizers", respectively. Since cells from different recipients can be configured to have the pathway overexpress different therapeutic proteins for use in a variety of disorders, the dimerizers have the potential to serve as "universal drugs". They can also be viewed as cell permeable, organic replacements for therapeutic antisense agents or for proteins that would otherwise require intravenous injection or **intracellular** expression (e.g., the LDL receptor or the CFTR protein).

1998:734993 Document No. 130:1173 Regulated apoptosis by chimeric proteins binding to FK506-type and cyclosporin-type ligands. **Crabtree, Gerald R.**; Schreiber, Stuart L.; Spencer, David M.; **Wandless, Thomas J.**; Belshaw, Peter (President & Fellows of Harvard College, USA; Board of Trustees of Leland Stanford Jr. University). U.S. US 5834266 A 19981110, 104 pp., Cont.-in-part of U.S. Ser. No. 179,143, abandoned. (English). CODEN: USXXAM. APPLICATION: US 1994-292597 19940818. PRIORITY: US 1993-17931 19930212; US 1993-92977 19930716; US 1993-93499 19930716; US 1994-179143 19940107; US 1994-179748 19940107.

AB A general procedure is described for the regulated (inducible) dimerization or oligomerization of **intracellular** proteins and methods and materials are presented for using that procedure to regulatably initiate cell-specific apoptosis (programmed cell death) in genetically engineered cells. The procedure involves chimeric (or fused) proteins, DNA constructs encoding them, and ligand mols. capable of oligomerizing the chimeric proteins. The chimeric proteins contain at least one ligand-binding (or receptor) domain fused to an action domain capable of initiating apoptosis within a cell (e.g., Fas or tumor necrosis factor receptor), and may also contain addnl. domains for (1) the regulatable or constitutive expression of desired genes and (2) **intracellular targeting**. The chimeric proteins are capable of binding to an FK506-type ligand, a cyclosporin A-type ligand, tetracycline, or a steroid ligand. One such chimeric protein is myristoylated CD3/FKBP12 (MZF3E) receptor consisting of (1) a c-src fragment sufficient for myristoylation, (2) the cytoplasmic tail of .zeta. (a component of the B cell receptor), (3) 3 consecutive domains of the FKBP12 immunophilin, and (4) a flu epitope tag; oligomerization/apoptosis is induced by a dimeric deriv. of FK506. Syntheses are reported for the

prepn. of dimeric and "bumped" (contg. steric bulky groups) derivs. of FK506 and cyclosporin A. The overall procedures allows ligand-mediated oligomerization for regulated gene therapy.

Klemm J D; Beals C R; **Crabtree G R.** (Howard Hughes Medical Institute, Department of Developmental Biology, Stanford University School of Medicine, Stanford, California 94305, USA. ) CURRENT BIOLOGY, (1997 Sep 1) 7 (9) 638-44. Journal code: 9107782. ISSN: 0960-9822. Pub. country: ENGLAND: United Kingdom. Language: English.

AB BACKGROUND: The transcription factor NF-ATc plays a key role in the activation of many early immune response genes and is regulated by subcellular localization. NF-ATc translocates from the cytoplasm to the nucleus in response to a rise in **intracellular** calcium, and immediately returns to the cytoplasm when **intracellular** calcium levels fall. The rapid nuclear exit of NF-ATc is thought to be one mechanism by which cells distinguish between sustained and transient calcium signals. RESULTS: To study the nuclear export of NF-ATc, we have developed a general, non-invasive assay for the identification and study of nuclear export signals (NESs). The NES is defined by its ability to translocate a protein from the nucleus to the cytoplasm when the two are tethered by a membrane-permeable ligand. This procedure has allowed us to identify a NES within NF-ATc that functions in concert with a glycogen synthase kinase-regulated process to direct the rapid nuclear exit of NF-ATc. CONCLUSIONS: The rapid nuclear export of NF-ATc via its NES and a glycogen synthase kinase-regulated event may be an important mechanism for insulating cells from transient spikes in **intracellular** calcium which might otherwise lead to inappropriate activation. The assay we have developed allows the rapid identification of NESs and can be used as a general method for the inducible cytoplasmic export of nuclear proteins.

APPLICATION: WO 1995-US10591 19950818. PRIORITY: US 1994-292595 19940818; US 1994-292596 19940818; US 1994-292597 19940818.

AB Materials and methods are disclosed for regulated obstruction of the expression of a target gene or the biol. effect of its gene product in genetically engineered cells or organisms contg. them. Aspects of the invention are exemplified by recombinant modifications of host cells and their use in vitro and in vivo for the regulatable blockade of expression of a target gene, for interference with the function or effect of a target gene product or for the regulatable elimination of a target gene. Synthesis of oligomer of ligands such as FK506 and cyclosporin A, and regulation of programmed cell death with immunophilin-Fas antigen chimeras were demonstrated.

Belshaw P.J.; Ho S.N.; **Crabtree G.R.**; Schreiber S.L.. Dept. of Pathology/Dev'tl. Biology, Howard Hughes Medical Institute, Stanford University Sch. of Medicine, Stanford, CA 94305, United States. Proceedings of the National Academy of Sciences of the United States of America 93/10 (4604-4607) 1996. ISSN: 0027-8424. CODEN: PNASA6. Pub. Country: United States. Language: English. Summary Language: English.

AB Extracellular growth and differentiation factors induce changes in gene expression in the nucleus by initiating a series of protein associations

that alter the subcellular localization of **intracellular** signaling proteins. Initial events involve receptor homo- or heterodimerization and subsequent recruitment of cytosolic signaling proteins to the inner leaflet of the plasma membrane. Intermediate events involve the translocation of proteins into the nucleus. Late events involve the recruitment of transcriptional activators to the vicinity of specific genes in the nucleus, resulting in increased gene transcription. The ability to induce signals at each of these three phases of signaling pathways is illustrated by the use of a heterodimeric chemical inducer of dimerization that causes a proximal relationship between two different target proteins.

AB A general procedure for regulating (inducing) dimerization or oligomerization of chimeric proteins is presented. The chimeric proteins contain a receptor domain and another protein domain capable of initiating a biol. process. The chimeric proteins can be induced to assoc. by

treating the cells or organisms that harbor them with cell-permeable, synthetic ligands. The dimers/oligomers bind to a transcription control element and stimulate transcription of the gene to which it is assocd. The syntheses of FK-506 dimers are presented. Such dimers were used to induce: (1) the **intracellular** aggregation of the cytoplasmic tail of the zeta chain of the T cell receptor (TCR)-CD3 complex thereby leading to signaling and transcription of a reporter gene, (2) the homodimerization of the cytoplasmic tail of the Fas receptor thereby leading to cell-specific apoptosis (programmed cell death) and (3) the heterodimerization of a DNA-binding domain (Gal4) and a transcription-activation domain (VP16) thereby leading to direct transcription of a reporter gene.

 90368794 Document Number: 90368794. PubMed ID: 2394747. Cell type specificity and activation requirements for NFAT-1 (nuclear factor of activated T-cells) transcriptional activity determined by a new method using transgenic mice to assay transcriptional activity of an individual nuclear factor. Verweij C L; Guidos C; **Crabtree G R**. (Howard Hughes Medical Institute, Stanford, California. ) JOURNAL OF BIOLOGICAL CHEMISTRY, (1990 Sep 15) 265 (26) 15788-95. Journal code: 2985121R. ISSN: 0021-9258. Pub. country: United States. Language: English.

AB Nuclear factor of activated T-cells (NFAT-1) is a transcription factor which is considered to be an important regulator in early T-cell activation. We have developed a system to monitor the transcriptional activity of NFAT-1 at the single cell level in whole animals. The system is based on the use of an oligomerized NFAT-1 binding motif that directs transcription of SV40 T-antigen in transgenic mice. This report represents the first demonstration that a multimerized short binding motif can function appropriately in transgenic mice. NFAT-1 activity had previously been thought to be confined to activated T-lymphocytes upon release of **intracellular** calcium. By **targeting** NFAT-1-dependent gene expression in transgenic mice we discovered new sites of NFAT-1 activity. Besides in T-lymphocytes NFAT-1 activity could also be induced in T-lymphocyte-depleted spleen cells and purified B-lymphocytes and requires agents that both release **intracellular** calcium and activate protein kinase C. A difference in the time course of appearance of NFAT-1 activity between T-lymphocytes and non-T-lymphocytes was revealed. Constitutive expression was observed in a small population of cells in the dermis and some mice have developed skin lesions. Interestingly, the tissue pattern of expression of the NFAT-1 activity resembles the expression pattern described for HIV-LTR/tat transgenic mice (Vogel, J., Hinrichs, S. H., Reynolds, R. K., Luciw, P. A., and Jay, G. (1988) Nature 335, 606-611). This similarity in expression and the fact that NFAT-1 has been shown to bind functional sequences in HIV-LTR suggest a role for NFAT-1 in dermal activation of the HIV-LTR.
